

Моделирование метаболических путей

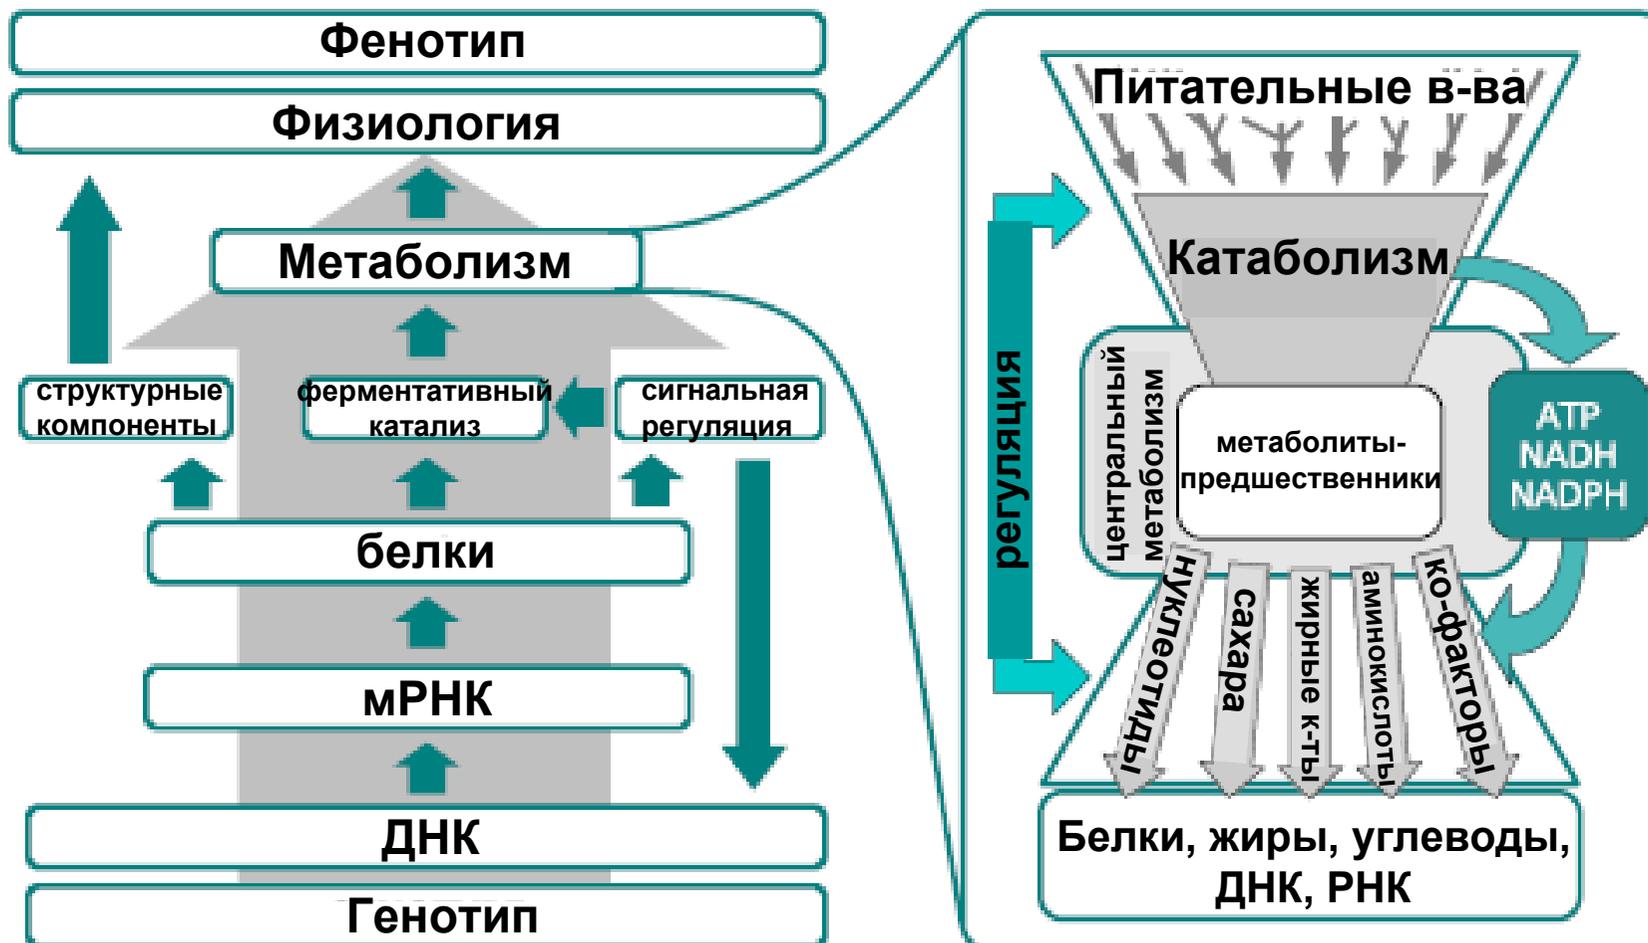

Плюснина Татьяна Юрьевна
Доц-т каф. биофизики
Биологического ф-та МГУ

Метаболизм (от греч. μεταβολή — «превращение, изменение»), — набор химических реакций, которые протекают в живом организме и способствуют поддержанию жизни.

Метаболический путь — совокупность метаболических реакций

Метаболиты — субстраты и продукты, участвующие в реакциях

Организация клеточного метаболизма

Цели и задачи метаболического моделирования

Научные задачи:

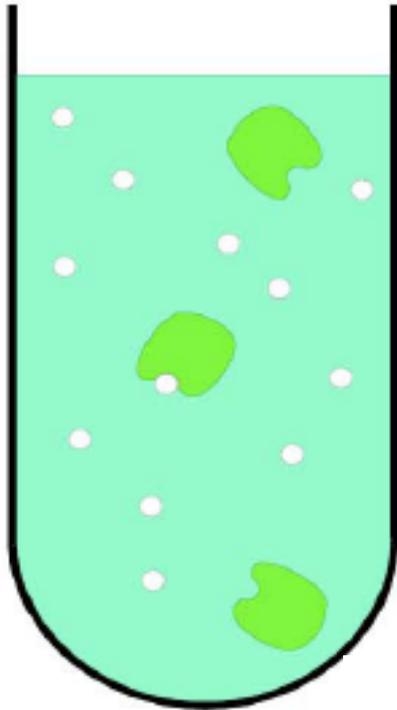

- исследование механизмов клеточной регуляции
- объяснение экспериментально установленных фактов
- предсказание новых ещё не выявленных внутриклеточных явлений
- систематизация накопленных экспериментальных данных

Биоинженерные задачи:

- получение необходимых веществ из бактериальных клеток и других организмов
 - разработка новых лекарств
 - получение биотоплива
- разработка новых штаммов с наперед заданными свойствами

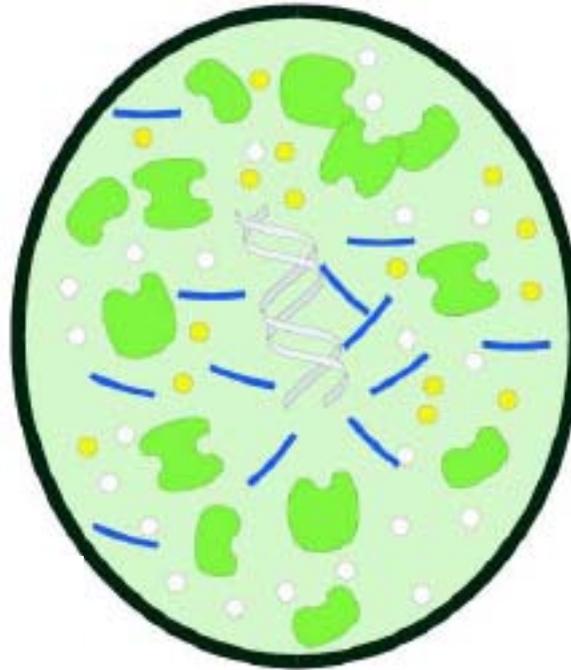

Уровни исследования метаболических реакций

Escherichia coli – удобный объект для моделирования
клеточного метаболизма

Метаболические пути *Escherichia coli*

- > 800 метаболических процессов
- > 400 метаболитов
- > 500 ферментов

Описание метаболизма включает:

- потребление необходимых для роста веществ из среды (мембранные транспортные процессы)
- центральные катаболические пути
- биосинтетические пути (продукция всех компонент биомассы)

англоязычный ресурс

The screenshot displays the NCBI website interface. At the top, there is a navigation bar with the NCBI logo and the text "National Center for Biotechnology Information". Below this, a search bar is visible with a dropdown menu showing "PubMed" selected. To the left, a vertical navigation menu lists various resources such as "NCBI Home", "Site Map (A-Z)", "All Resources", "Chemicals & Bioassays", "Data & Software", "DNA & RNA", "Domains & Structures", "Genes & Expression", "Genetics & Medicine", "Genomes & Maps", "Homology", "Literature", "Proteins", "Sequence Analysis", "Taxonomy", "Training & Tutorials", and "Variation". In the center, a search bar is present with a "Search" button and a "Clear" button. Below the search bar, there is a section titled "Education Resources" with a description: "Central point of access for help documents, teaching materials, news outlets, and other educational resources." To the right of this section is a small image showing a person at a computer. Below the "Education Resources" section is a pagination bar with numbers 1, 2, 3, 4, 5, where 2 is highlighted. On the right side of the page, there are two sections: "Popular Resources" and "NCBI News". The "Popular Resources" section lists various tools and databases like BLAST, Bookshelf, Gene, Genome, Nucleotide, OMIM, Protein, PubChem, PubMed, PubMed Central, and SNP. The "NCBI News" section contains two news items: "New NCBI News Issue" dated 28 Mar 2011 and "Retirement of Peptidome, SRA & Trace Archive" dated 16 Feb 2011.

METACYC OVERVIEW

MetaCyc is a database of nonredundant, experimentally elucidated metabolic pathways. MetaCyc contains more than 1670 pathways from more than 2100 different organisms [\[more\]](#), and is curated from the scientific experimental literature. [\[more\]](#)

MetaCyc contains pathways involved in both primary [\[def\]](#) and secondary [\[def\]](#) metabolism, as well as associated compounds, enzymes, and genes. [\[more\]](#)

Motivations

The goal of MetaCyc is to catalog the universe of metabolism by storing a representative sample of each experimentally elucidated pathway. [\[MetaCyc mission\]](#)

MetaCyc is used in a variety of scientific applications, such as providing a reference data set for computationally predicting the metabolic pathways of organisms from their sequenced genomes, supporting metabolic engineering, helping to compare biochemical networks, and serving as an encyclopedia of metabolism. [\[scientific applications\]](#)

Recent Publication

- [The MetaCyc Database of metabolic pathways and enzymes and the BioCyc collection of Pathway/Genome Databases](#), *Nucleic Acids Research* 38:D473-D479 2010.

Query and Visualization

MetaCyc pathways can be browsed from a list, from ontologies [\[def\]](#), or queried directly when searching for pathways, proteins, reactions or compounds. [\[more\]](#) MetaCyc can also be queried programmatically using [Java](#) or [PERL](#) when installed locally. [\[more\]](#)

New Users

Get a bird's eye view of the MetaCyc web site [here](#).

Построение метаболической модели

“The simplest living cell is so complex that supercomputer models may never simulate its behavior perfectly. But even imperfect models could shake the foundations of biology.”

W.Wayt Gibbs. Scientific American, 2001

«Простейшая клетка настолько сложна, что даже моделирование на суперкомпьютерах никогда не воспроизведет ее поведение в совершенстве. Но даже несовершенные модели могут потрясти основы биологии.»

Теоретические подходы и концепции метаболического моделирования

Классический системный подход

1. выделить элементарные единицы системы
2. охарактеризовать все значимые взаимодействия между единицами
3. организовать единицы как иерархию взаимодействующих модулей
4. описать состояние каждой единицы и каждого взаимодействия количественно

Данные для верификации метаболической модели

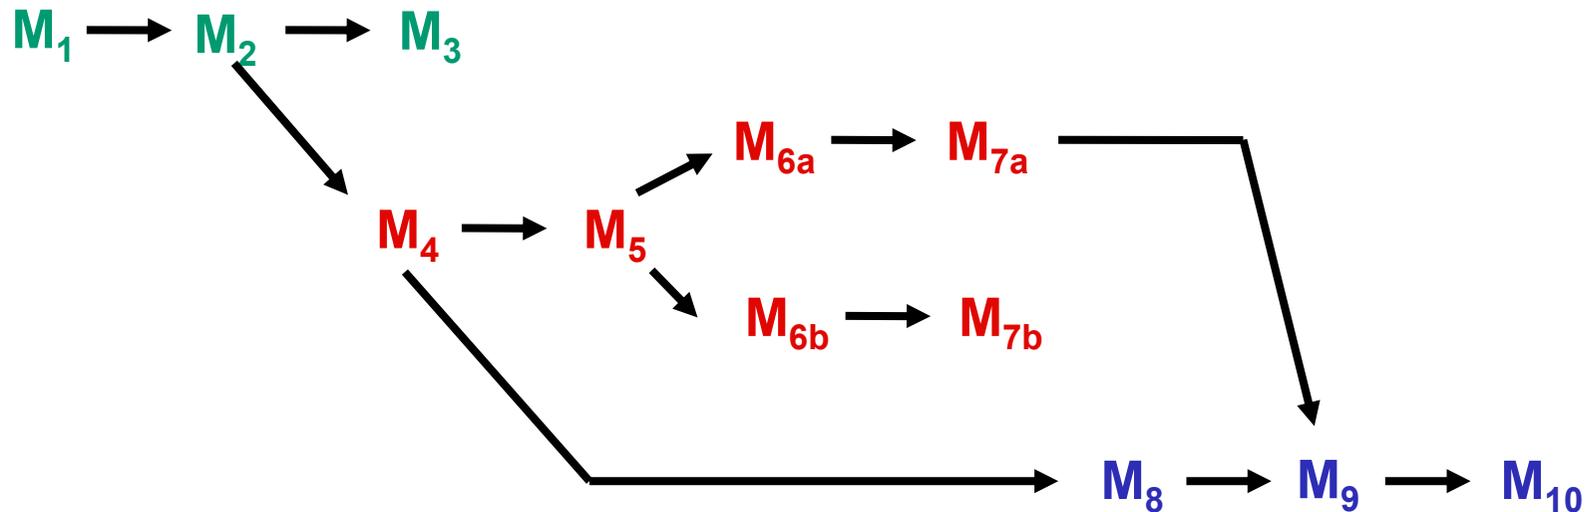

1. Многие (но не все) внутриклеточные концентрации метаболитов могут быть измерены.
2. В стационарном состоянии большинство метаболических потоков может быть определено с помощью изотопа ^{13}C .
3. Активности ферментов могут быть определены из клеточных экстрактов.
4. Кинетические константы большинства ферментов определены и собраны в базы данных.

Количественные знания ограничены

1. Существует большая разница между дискретными данными, получаемыми в экспериментах и непрерывными физиологическими процессами.
2. Данные о некоторых важных клеточных процессах пока отсутствуют.
3. Принципиальное ограничение доступной информации.
4. Данные собираются для разных штаммов разных организмов в разных экспериментальных условиях.

Как строятся метаболические модели

1. Метаболическая реакция добавляется, убирается или заменяется на другую.
2. Механизм реакции усложняется, упрощается, заменяется другим.
3. Неизвестные кинетические параметры оцениваются с помощью фитирования.

Типы метаболических моделей

кинетические модели – системы ОДУ

- (~10-50 уравнений, ~100-500 параметров)
- переменная модели - метаболит
- описание отдельных метаболических путей
- решение модели – динамическое поведение метаболитов во времени

стехиометрические (потоковые) модели – системы линейных алгебраических уравнений

- (~100-1000 уравнений)
- переменная модели – метаболический поток
- описание метаболизма целой клетки
- решение модели – стационарное распределение метаболических потоков

Представление скорости реакции

В соответствии с законом действующих масс

(скорость реакции пропорциональна вероятности столкновения реагентов, а вероятность в свою очередь пропорциональна концентрации реагентов с учетом молекулярности реакции)

$$v = k_1 S_1 S_2 - k_{-1} P^2 = v_+ - v_-$$

v - общая скорость реакции

v_+ - скорость прямой реакции

v_- - скорость обратной реакции

В общем виде:

$$v = v_+ - v_- = k_+ \prod_i S_i^{m_i} - k_- \prod_j P_j^{m_j}$$

m_i и m_j соответствуют молекулярности S_i и P_j

Скорость реакции может быть выражена как через **концентрации** реагирующих веществ, так и в виде баланса **скоростей** прямых и обратных реакций.

Стехиометрические коэффициенты

Стехиометрические коэффициенты обозначают пропорции субстратов и продуктов, участвующих в реакции.

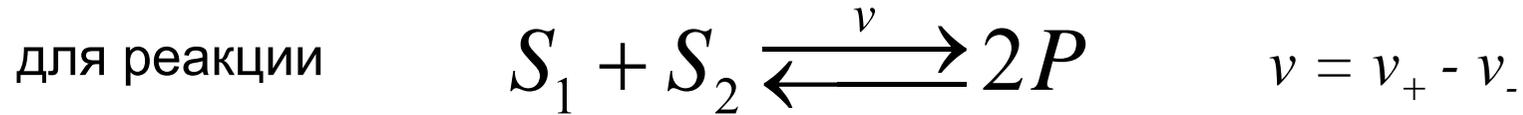

Стехиометрические коэффициенты для S_1 , S_2 и P : -1, -1 и 2.

Набор стехиометрических коэффициентов не единственен:

если считать, что для получения одного моля используется по половине моля каждого субстрата S_1 и S_2 , можно записать: -1/2, -1/2 и 1;

или если изменить направление реакции, тогда можно записать: 1, 1 и -2.

ОДУ для одной и нескольких реакций

имеем ОДУ:

$$\frac{dS_1}{dt} = \frac{dS_2}{dt} = -v$$

$$\frac{dP}{dt} = 2v$$

убыль субстрата S_1 со скоростью v сопровождается убылью субстрата S_2 с той же скоростью и удвоенной скоростью увеличения концентрации продукта P

$$\frac{dS_i}{dt} = \sum_{j=1}^r n_{ij} v_j$$

n_{ij} – стехиометрические коэффициенты метаболита i в реакции j $i = 1, \dots, m$

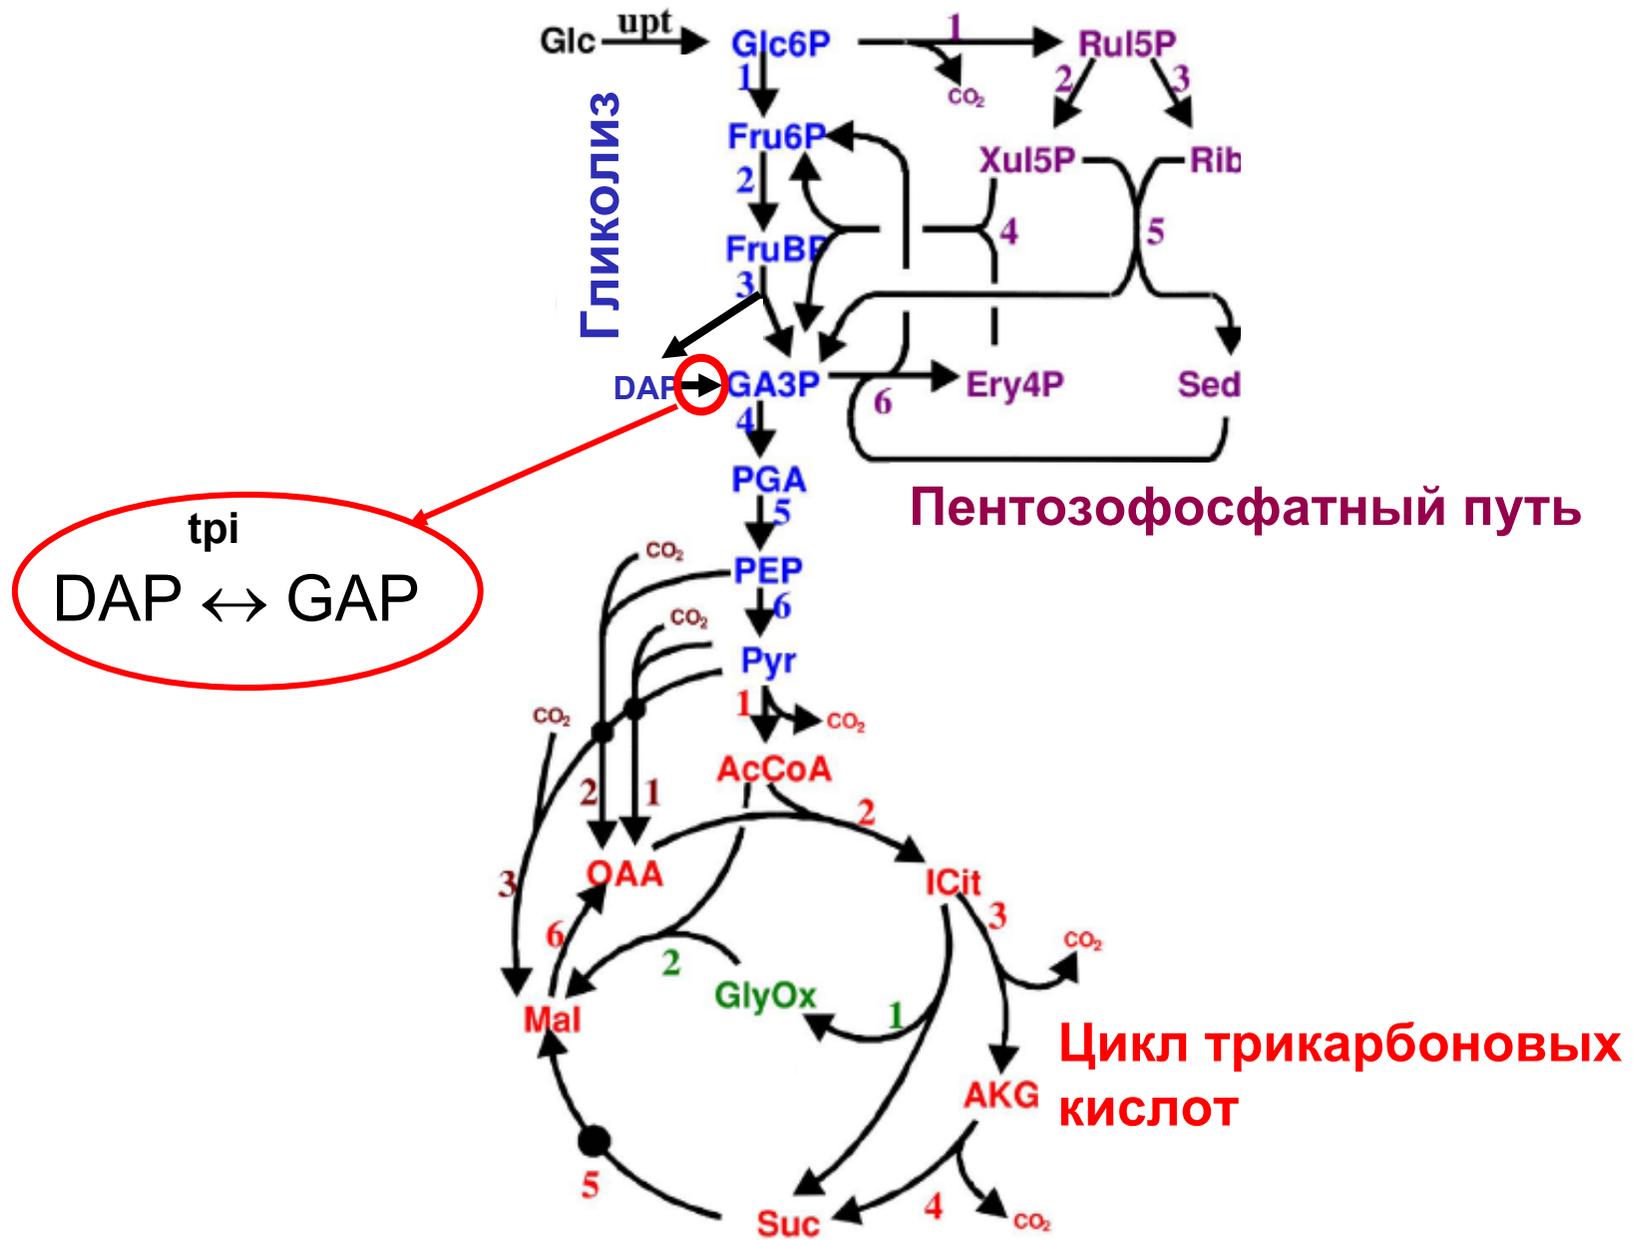

Для метаболической сети, состоящей из m метаболитов и r реакций, динамика системы описывается системой m уравнений.

Уравнения наз. уравнениями баланса, поскольку рассматривается баланс между синтезом и распадом метаболита:

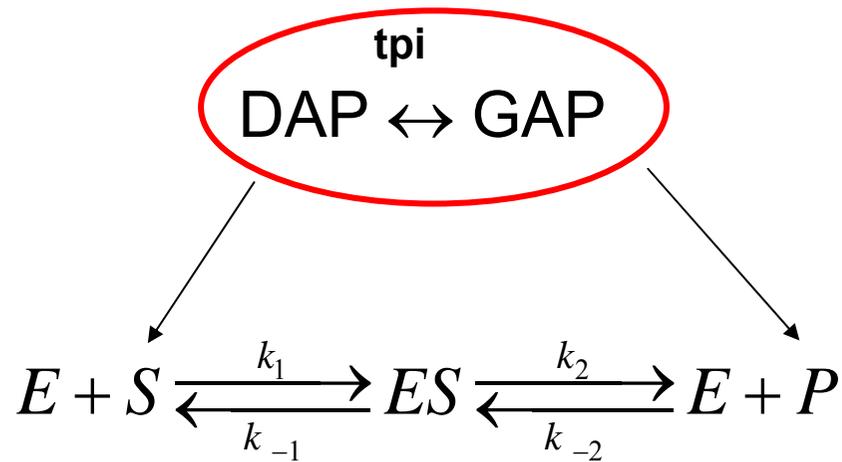

Кинетические модели

- построение схемы метаболического пути
- вывод уравнения скорости для каждой реакции
- объединение в систему дифференциальных уравнений
- подбор параметров
- верификация модели по экспериментальным данным

Центральные метаболические пути

Кинетическая схема взаимодействия субстрата и продукта с ферментом

Каталитический цикл фермента

Вывод уравнения скорости

Метод квази-стационарных концентраций

Кинетическая схема взаимодействия субстрата и продукта с ферментом:

Соответствующая система дифференциальных уравнений:

$$\left. \begin{aligned} \frac{dS}{dt} &= -k_1 \cdot S \cdot E + k_{-1} \cdot ES \\ \frac{dP}{dt} &= k_2 \cdot ES - k_{-2} \cdot E \cdot P \end{aligned} \right\} \text{медленные переменные}$$

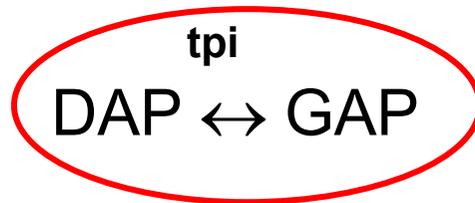

$$\left. \begin{aligned} \frac{dE}{dt} &= -k_1 \cdot S \cdot E + k_{-1} \cdot ES + k_2 \cdot ES - k_{-2} \cdot E \cdot P \\ \frac{dES}{dt} &= k_1 \cdot S \cdot E - k_{-1} \cdot ES - k_2 \cdot ES + k_{-2} \cdot E \cdot P \end{aligned} \right\} \text{быстрые переменные}$$

Уравнение скорости:

$$\frac{dP}{dt} = -\frac{dS}{dt} = V = E_0 \frac{k_2 \frac{S}{K_m^S} - k_{-2} \frac{P}{K_m^P}}{1 + \frac{S}{K_m^S} + \frac{P}{K_m^P}}$$

Определение констант скорости

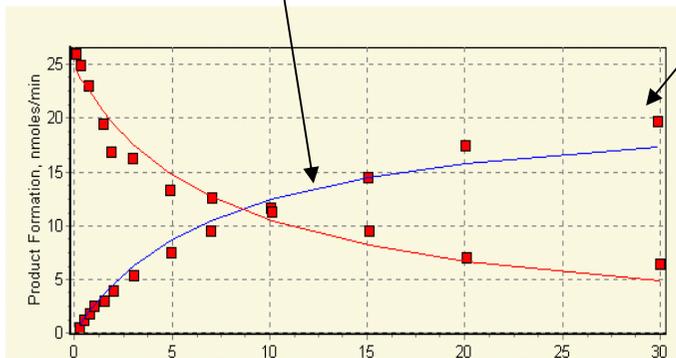

для триозофосфат изомеразы (tpi)

$$V = E_0 \frac{k_2 \frac{C_{DAP}}{K_m^{DAP}} - k_{-2} \frac{C_{GAP}}{K_m^{GAP}}}{1 + \frac{C_{DAP}}{K_m^{DAP}} + \frac{C_{GAP}}{K_m^{GAP}}}$$

фитирование методом
наименьших квадратов

экспериментальные
точки

$$K_m^{DAP} = 2.3 \text{ mM}$$

$$K_m^{GAP} = 1.5 \text{ mM}$$

$$k_2 = 45000 \text{ 1/min}, \\ k_{-2} = 520000 \text{ 1/min}$$

Effects of inherited mutations on catalytic activity and structural stability of human glucose-6-phosphate isomerase expressed in *Escherichia coli*.

Lin HY, Kao YH, Chen ST, Meng M.

Graduate Institute of Biotechnology, National Chung Hsing University, Taichung, Taiwan 40227, Republic of China.

Abstract

Glucose-6-phosphate isomerase (GPI), a homodimeric enzyme, catalyzes the interconversion between glucose-6-phosphate and fructose-6-phosphate. In mammals, it can also act as an autocrine motility factor, neuroleukin, and maturation factor. Deficiency of the enzymatic activity in red blood cells causes nonspherocytic hemolytic anemia in human. To gain a more complete understanding of the molecular basis for the hemolytic anemia due to the GPI-deficiency, the wild-type enzyme and sixteen genetic variants were expressed in *Escherichia coli* and functionally characterized. Conclusions are as follows: (1) mutations usually have negative influences on catalytic parameters, particularly k_{cat} , as well as structure stability; (2) mutations at or close to the active site, including R273H, H389R, and S278L, cause great damage to the catalytic function, yet
